Educational programme of the road weather principles subject which is lectured in the Czech University of Life Sciences Prague

University of Life Sciences in Prague Department of Agroecology and Biometeorology, Kamýcká 129, CZ-165 21 Prague, Czech Republic, E-mail: pivec@af.czu.cz

Dr.Ing. Jan Pivec
The Faculty of Engineering offers its prospective students three year Bachelor degree courses and two year Master degree courses within the scope of two-stage study plans. The Master degree course graduates are offered three year postgraduate courses among others in the field of Road transportation and city traffic.

Within the subject of road transportation and city traffic we provide essential knowledge about the Earth’s atmosphere and physical processes which determine its properties and behaviour; atmospheric composition and energy, water in the atmosphere and air circulation (global, synoptic and local scales). The Course continues in the description of the climate in the World. Special emphasis is put on the problems of transport meteorology, a guide to the road weather systems and SIRWEC suggestions.
Road Weather Information Systems around the World

Roads are set up by sensors, installed into the pavement or runways for their temperature and humidity, wind speed and direction measurements, precipitation characteristics and visibility. Measured data are transmitted by wireless technology to the processing places, than to the end-users.

Ice formation in the pavement surface: \( T_p < T_{dew} \& T_p < 0^\circ C \)
COST – European Cooperation in the field of Scientific and Technical Research – is one of the longest-running European instruments supporting cooperation among scientists and researchers across Europe.

**COST Transport** is one of 17 domains existing in COST at the present time.

The main research areas of COST 309 were defined as: road weather detection, forecasting, statistics and service strategies. The specific topics explored were:

- Sensors and measuring systems
- Overall systems, thermal mapping, data transmission
- Fog detection and prediction
- Weather radar
- Short term and immediate prediction of road conditions
- Weather index
- Weather and accidents
- Cost-benefit analysis of road weather services
- Communication between meteorologists and road maintenance authorities
- Dissemination of information between meteorological stations/to road users
- Effects of de-icing agents

**COST 309**

**Road Weather Conditions**
Intelligent Traffic Systems:

**FRENSOR®**
**Freezing Point Detection**

A unique, patented monitoring device which is by far more accurate and reliable than traditional ‘Bridge Freeze First’ warnings.

The Frensor is used at airports and for detecting road conditions status. The Frensor can also be installed as a mobile unit collecting road surface freezing temperatures in real time along the road. The Frensor can be connected to any host system via a serial port.

**Optic Eye™**
**Precipitation Sensor**

This extremely compact ITS Technology device doesn’t only measure precipitation intensity in general, it also classifies rain, snow, sleet and drifting snow.

Infrared beams forming a horizontal cross alter in intensity when being exposed to various kinds and quantities of precipitation. The Optic Eye registers and analyses the precipitation situation continuously and can be connected to any host system via a serial port.

The Optic Eye can also form the basis for a low cost aqua planning warning system.

**ADVICY**
**Ice Warning System**

The ADVICY System, developed by ITS Technology, doesn’t only prevent fatal runway accidents, it also minimizes use of expensive and polluting chemicals. As does it reduce time and costs for anti icing operations and minimize holding times for scheduled departures.

**RWIS**
**Road Weather Information System**

The RWIS, originally tailored made by ITS Technology in close cooperation with, the Swedish National Road Administration (SNRA) is one of the world’s most comprehensive networks of its kind.

The RWIS integrates some 700 field stations in a national roadside datagathering system which saves lives and cuts costs in a Nordic Climate that is extremely hazardous.

The RWIS is, in fact, road traffic intelligence on a national scale in general and on a local and human-related scale in particular.

This gigantic ITS solution, since long positively evaluated, can be individually adopted to specific road, traffic and climatological conditions anywhere in the world.
Surface Condition Management

Snow removal in a convoy
(with de-icing)

Sweeper for apron

Pump station

Measuring station

Snow removal in a convoy

Pick up glycol with rear suction unit

Fixed de-icing technology

Snowblower for apron, taxiways and runways

De-icing of runways, taxiways and aprons

BOSAT system

Parking cleaning

Street cleaning

Boschung - Switzerland
Atmospheric & Weather Sensors:
Our weather instruments are very successful in areas ranging from road weather information, research, aviation, to synoptic observation.

The LEDWI® (Light Emitting Diode Weather Identifier) applies OSI's patented light scintillation theory and uses opto-electronic technology for the identification of precipitation type. It can also provide an accurate measurement of precipitant quantity.

WIVIS® (Weather Identifier & Visibility Sensor), our premier present weather sensor, is an automated instrument providing accurate visibility and precipitation measurements. The sensor detects rain, snow, and mixed precipitation conditions.

The VIS (Visibility Sensor) uses the same reliable optical technology employed in the high-end present weather sensor, the WIVIS®, to measure visibility. Whether its fog detection on a highway or at an airport, the VIS can operate in a broad range of applications.

The LOA (Long Baseline Optical Anemometer and Turbulence Sensor) is a very powerful instrument. It measures path integrated crosswinds and turbulence intensity.

The ORG® is OSI's automated rain gauge. The instrument provides accurate measurement of rain rate. This ability makes the instrument more reliable than traditional tipping buckets or collection gauges which have problems with very light and heavy events.
Vaisala ROSA Weather Station - continued

Using the measurement data produced by the sensors, the ROSA Ice Warning Station determines the anti-icing chemical concentration, freezing point temperature and surface state. The surface state classifications are:

- Dry
- Moist (& chemical)
- Wet (& chemical)
- Frosty
- Snowy
- Icy

The following alarms can be generated:
- Rain warning
- Frost warning
- Ice warning
- Ice alarm

Vaisala Rail Weather Stations

Railways and metro systems are special environments with unique requirements and regulations. Vaisala can supply rail, light rail and metro system authorities with modular, automatic weather stations that are specially adapted to the railway environment from the widely used ROSA Ice Warning stations.

Vaisala Thermal Mapping

Some sections of a highway or runway will always be warmer or colder than others. This pattern of temperature variation is determined by local environmental factors and prevailing weather conditions. On a winter's night minimum pavement surface temperatures may vary by up to 7.0°C, creating problems for winter maintenance engineers dealing with snow and ice hazards. Thermal Mapping is a vehicle-based survey technique, scientifically proven to identify and quantify the distribution of temperature differences across a network.

Key benefits of Thermal Mapping:
- Identification of danger areas that may not be apparent from only using weather stations.
- Identifies the optimum location and number of weather stations.
- Enables the provision of Forecast Thermal Maps in an IceCast system.
- Enables selective anti-icing strategies that only target those areas in need of treatment.
- Key input data for Route Optimisation.
- Provides quantitative reference data.

Bridge Weather Applications

The hazards of ice, wind and low visibility are compounded on bridges. For this reason, Vaisala delivers a package of products and services to help road authorities to manage the special hazards of bad weather on bridges. These include a specially designed bridge-deck sensor that measures bridge surface state, temperature and depression of freezing point. We also provide wind measurement systems that process standard parameters (average, gust, direction, speed) and trigger alarms when they are exceeded.
Vaisala Ultrasonic Wind Sensor WS425
With its continuous data availability, the WS425 is ideal for a variety of wind measurement applications such as meteorology, aviation, road and railway safety and energy production.

Vaisala Wind Sensor WM30
The WM30 wind sensor is a compact, economical wind speed and direction sensor. The rotating cup anemometer at the top of the unit provides a linear response to wind speed. The vane, which is attached to the body of the unit, provides a fast response to wind direction.

Vaisala MIDAS IV LLWAS Low-Level Windshear Alert System
The Vaisala MIDAS IV LLWAS is a ground-based system that detects low-level windshear in runway corridors. At airports that are known to experience low-level horizontal windshear, the MIDAS IV LLWAS can be fundamental to improving safety and operating efficiency. The system gives visual and audio alerts to air traffic controllers and other airport personnel in clear and concise numerical and/or graphical form.

Vaisala AW11 Aviation Weather Reporter
The fully automatic AW11 is a stand-alone weather observation and reporting system designed for small airports, heliports and unmanned airstrips. The AW11 measures all standard aviation weather parameters and generates accurate real-time weather reports. Standard measurements include sky condition (cloud layer height and coverage), visibility, air pressure, temperature, dew point, and wind speed and direction. Precipitation occurrence and intensity measurements are also available.
Transportation
Wind and temperature monitoring system for bridge traffic safety and local weather reporting on the Mackinac Bridge connecting Michigan's upper and lower peninsula.
