Samu Karanko, Foreca Ltd

**MDSS SNOW ACCUMULATION
PERCENTAGE
BASED ON ROAD SEGMENT
MAINTENANCE REQUIREMENTS**

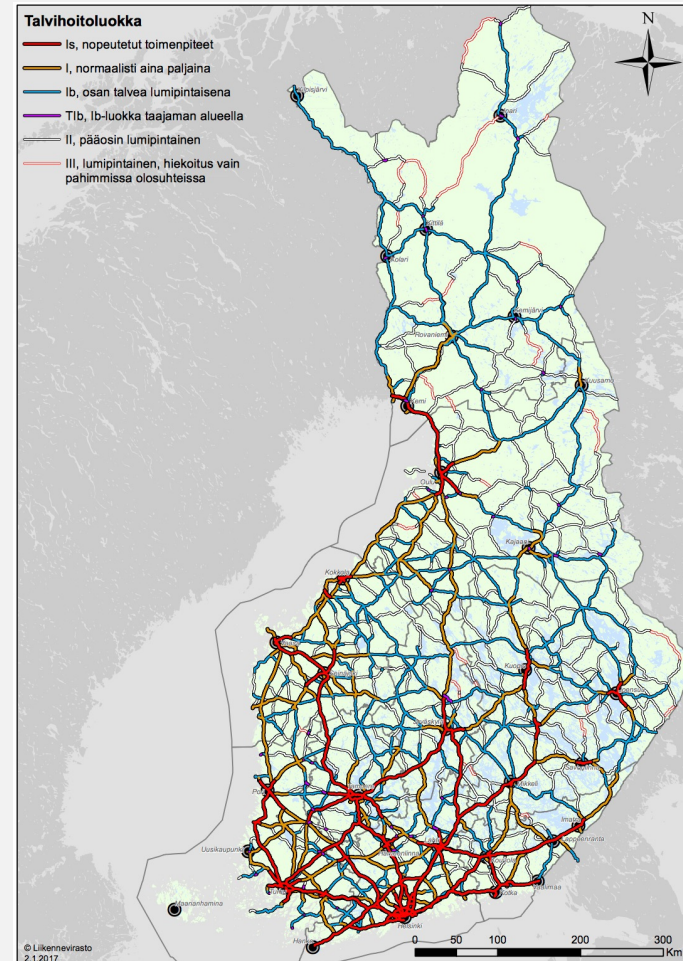

Orientation

- Custom DSS for the Finnish Transport Agency's supervisors
- Finland is in Northern Europe
- Winter maintenance period: mid September to mid May
- Snow cover days:
 - ~100 in the South
 - >200 in the North

Road Winter Maintenance

- The State road network comprises 78,000 km
- Finnish Transport Agency (FTA) contracts out all winter maintenance
 - Divided into 79 contract areas
 - Supervisors employed by the FTA
- Six different winter maintenance classes ranging from:
 - always attempt preventive de-icing, black roads
- to:
 - hard-packed snow most of the winter

Winter Maintenance Classes

- Max snow depth
- Time to act

Winter Maintenance Class	Max Snow Depth During Snow Fall (cm)		Time to Act (h)	
	Loose Snow	Slush	Loose Snow	Slush
Is	4	2	2,5	2
I	4	2	3	2,5
Ib ja IIb	4	2	3	3
II	8	4	4	4
III	10	5	6	6

The maintenance classes and snow accumulation have variation

→ Difficult to see where ploughing thresholds are first triggered during an event

Winter Maintenance Class	Max Snow Depth During Snow Fall (cm)		Time to Act (h)	
	Loose Snow	Slush	Loose Snow	Slush
Is	4	2	2,5	2
I	4	2	3	2,5
Ib ja IIb	4	2	3	3
II	8	4	4	4
III	10	5	6	6

Traditional services for contractors

Case example from April 2nd 2018 – snow fall

Case example from April 2nd 2018 - snow accumulation development 1/3

Email
alert

From: Snow accumulation service
To: Supervisor Matti Auranen
Subject: Snowfall started Mon 2nd Apr, route 7

Snowfall has started Monday 2nd April 05:00 am on road 101, contract area Espoo, route 7.

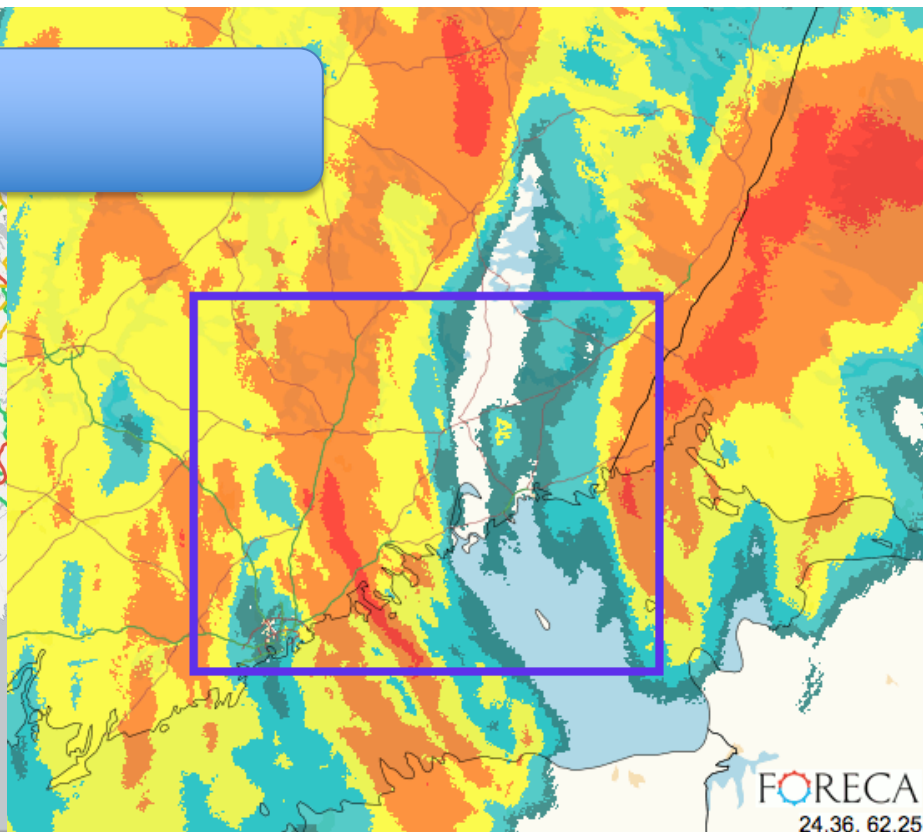

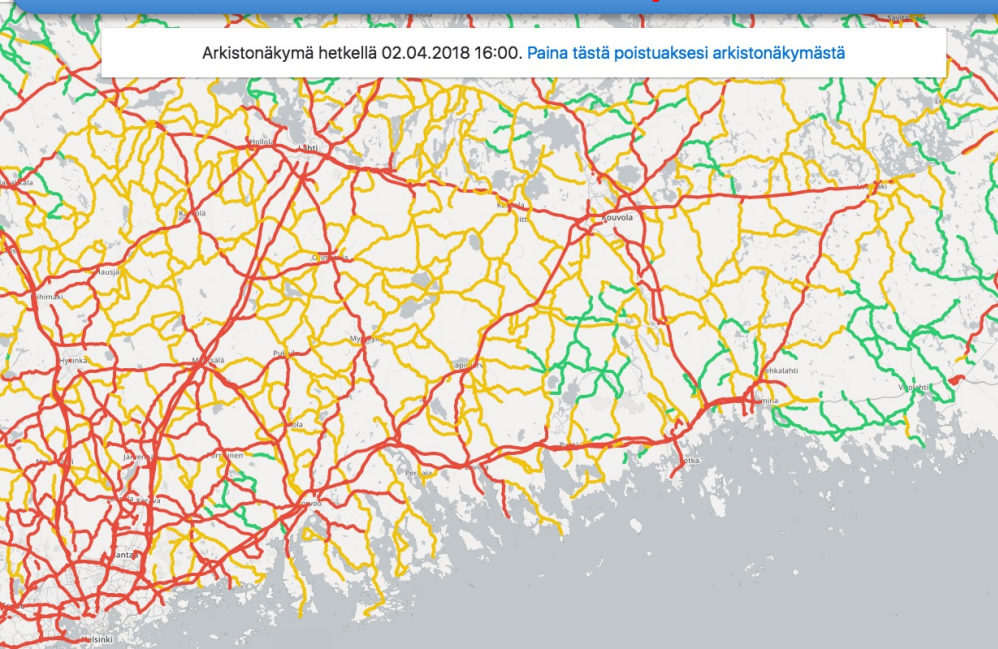

Snow accumulation is first predicted to exceed the maximum allowed snow depth Monday 2nd April 09:00 am.

Click [here](#) to open route 7 in the service.

Case example from April 2nd 2018 - snow accumulation development 2/3

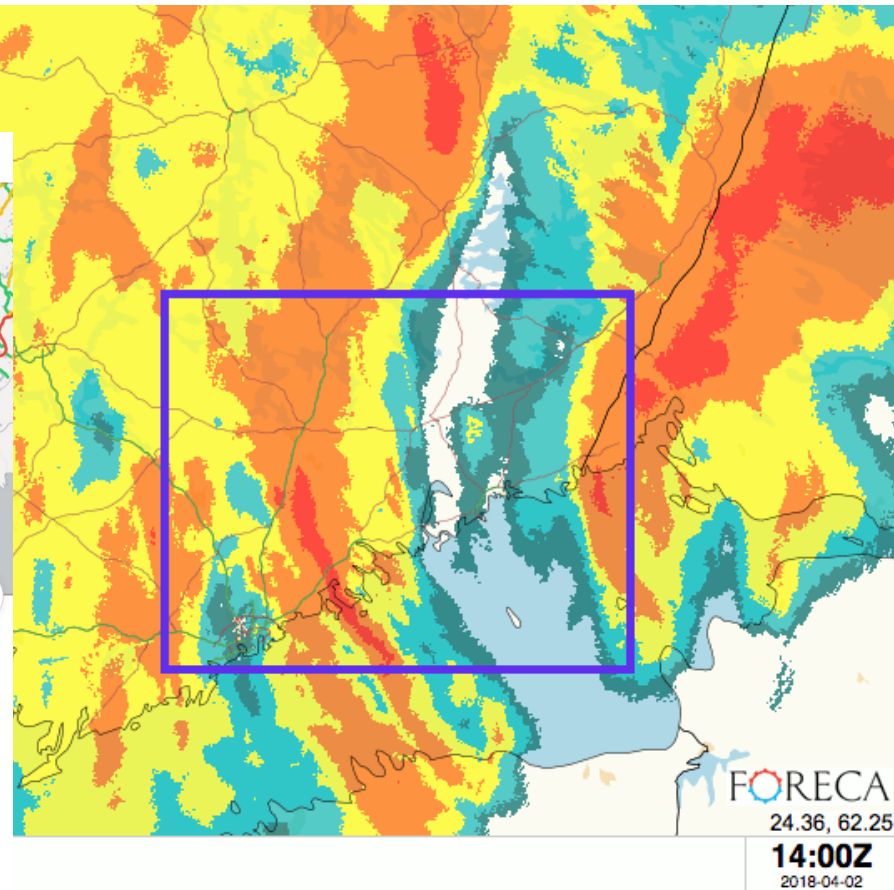

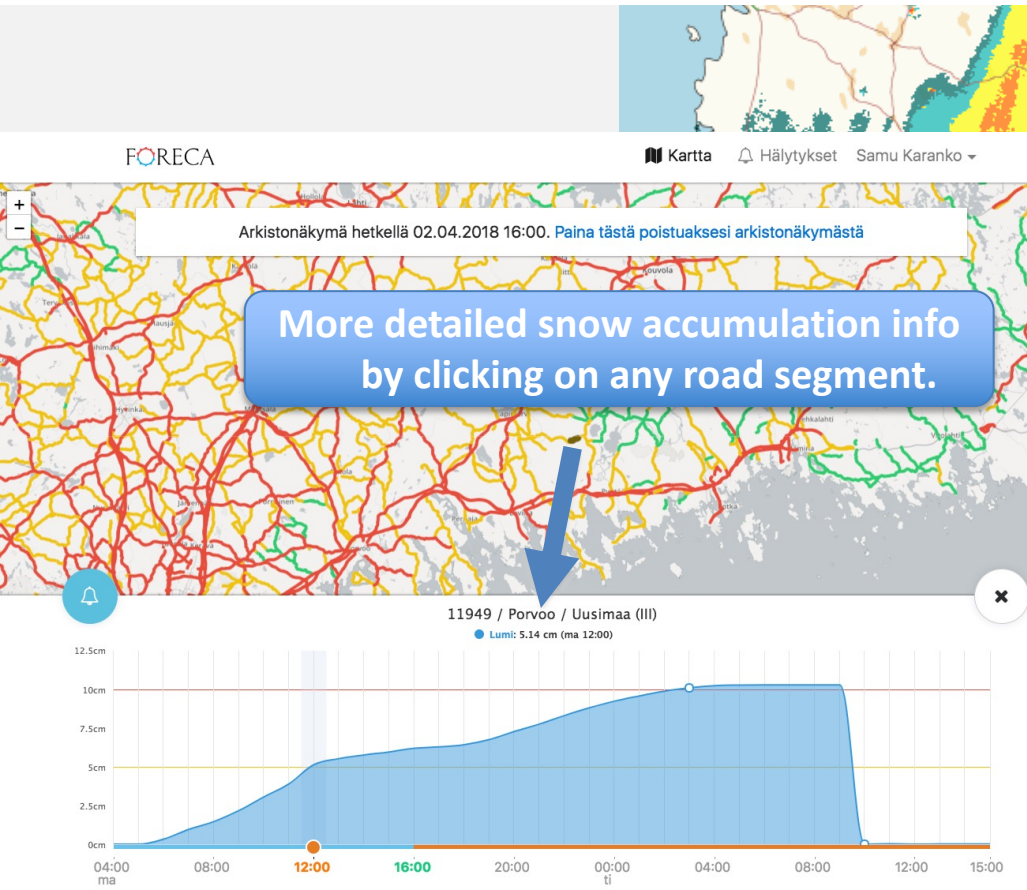

Ploughing threshold triggered
Maximum allowed snow depth reached

Case example from April 2nd 2018 - snow accumulation development 3/3

First tests in 16-17, production service 17-18

- **Coverage:** entire Finland, 78,000 km
- **Resolution:** 1 km road segments
- **Snapshot archives:** hourly
- **Data sources:**
 - **Winter maintenance classes from the road registry**
 - **Plough routes (not from all contracts)**
 - **Radar observations**
 - **Radar extrapolation**
 - **Ground stations, SMHI MESAN**
 - **Manually edited snow forecast**

NWP forecast data would not be enough to make the 1 km resolution meaningful:
a simple map of maintenance classes would suffice. **Radar is required!**

Snow accumulation based on radar:

- Fluff factor: SMHI's theoretical fluff factor formula experimentally fitted in Finland over a large dataset in low-wind situations
- Aggressive radar filtering (false alarms bad)
- Real-time tuning of accumulation based on hourly SYNOP data
 - Radar echoes in the vicinity of the station are examined for whether they could explain the measured precipitation at the station location
 - Scaling factors from neighboring stations averaged.

Improvements being considered:

- Including real-time de-icing and ploughing information once available from the entire country
- Advection based adjustment of radar measurements
