# Weather and Traffic

- Adverse weather – no longer a given fate
- Future road management systems require
  - tailored and designed information on adverse weather
  - information sharing
  - translation of weather into impact (categories) - > business cases
  - integration of wx impact in the management processes for decision making
  - on tactical and strategic, local and regional levels / time scales
- Three meteorological approaches are necessary
  - sufficiently dense weather monitoring (profiling) -> diagnosis/analysis
  - very short-term prediction (from now up to 1-6 h) -> now-casting
  - numerical weather prediction (beyond ~ 6 h) -> forecasting

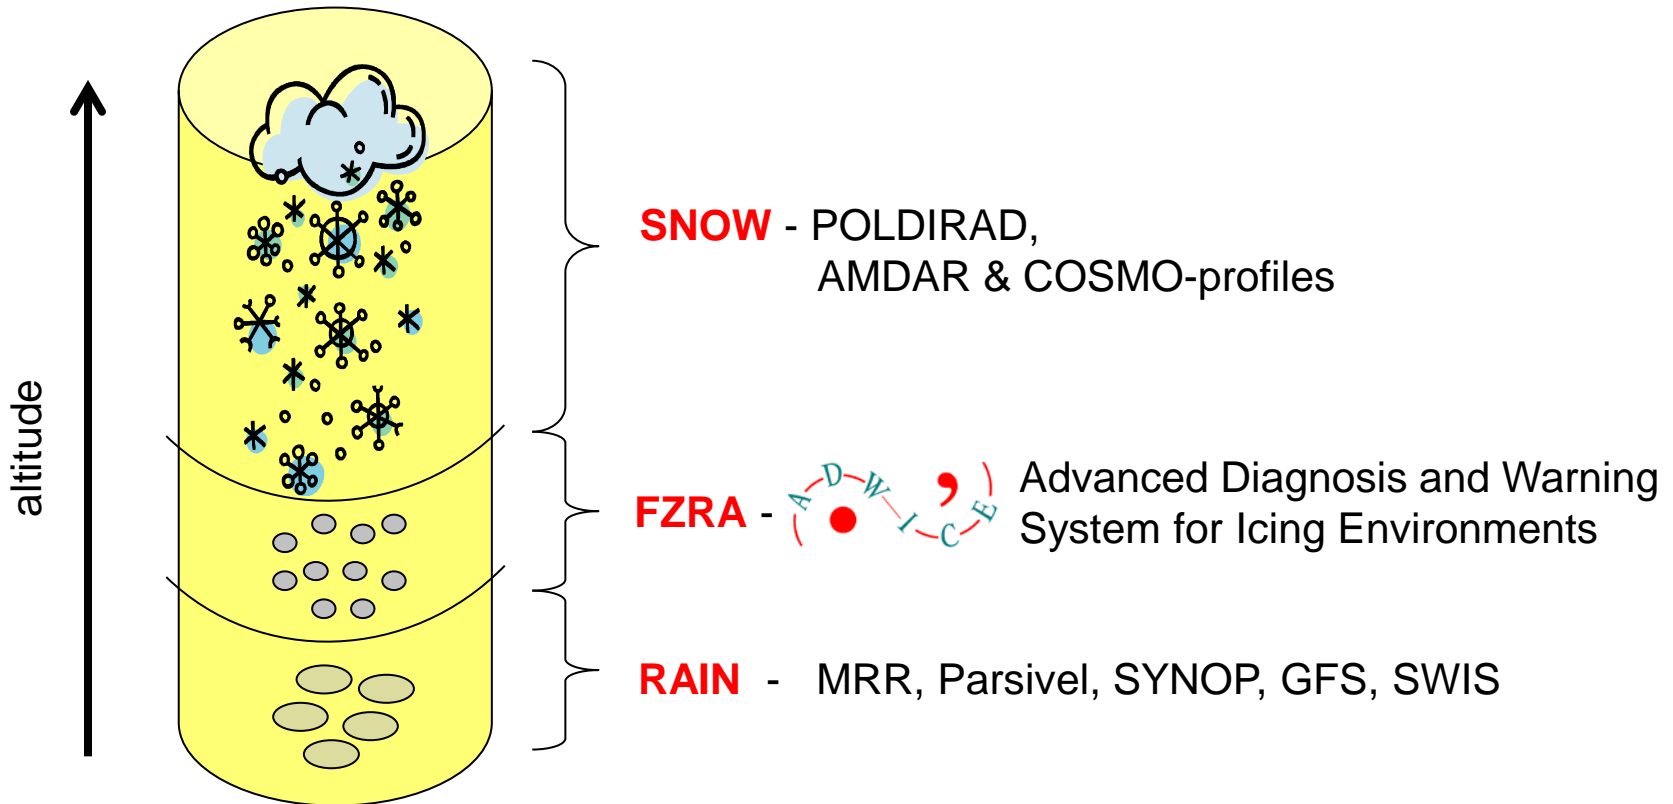

# Tailored and On-time Weather Information for Traffic

- Reduce complexity:  
Derive simple objects with attributes that describe the hazardous event on a local level to the users
- The message must be self-explaining, unambiguous and consistent
- The message must be tailored and detailed to the needs of the different users
- The impact of weather on traffic must be determined  
derive business cases with end users (e.g. major transportation companies)

# x FUSION Weather Forecast User-oriented System Including Object Nowcasting

# Definition of a Winter Weather Object

- AMDAR → temperature & humidity profiles
- POLDIRAD → hydrometeor information (volume, high res.)
- PARSIVEL → size and fall speed of particles
- MRR → Raindrop size distribution and rain rate

# Nowcasting concept

## Analysis

- Use all available local data with high refresh rates
- Apply fuzzy logic

} WWO

## Trend

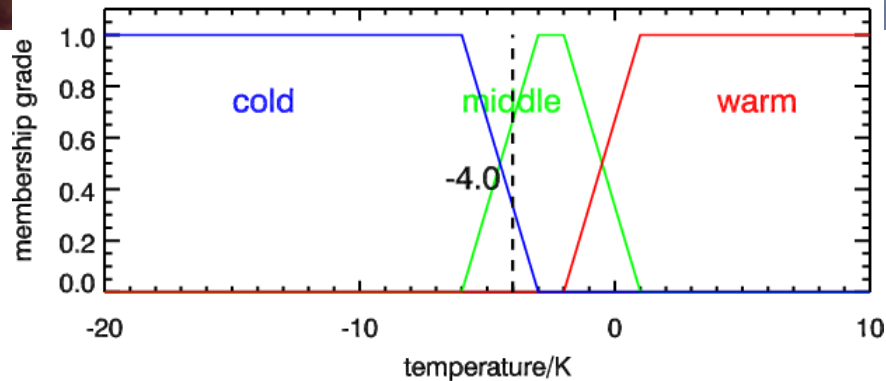

- Take into account changes of local measurements
- Use forecast data of COSMOMUC for trend estimates
- Take into account diagnostics at surrounding stations:  
advection of upstream weather

## Nowcast

Combine analysis with trend to estimate conditions up to 2 hours

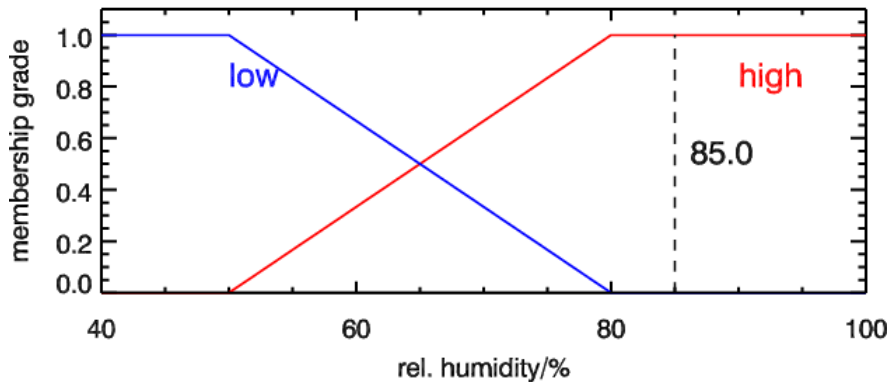

Surface Temperature

Hydrometeor Fall Speed

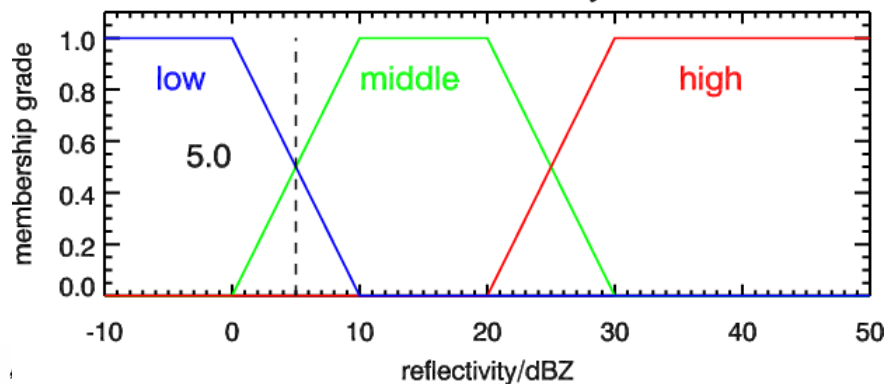

Relative Humidity at surface

Output Fuzzy Sets

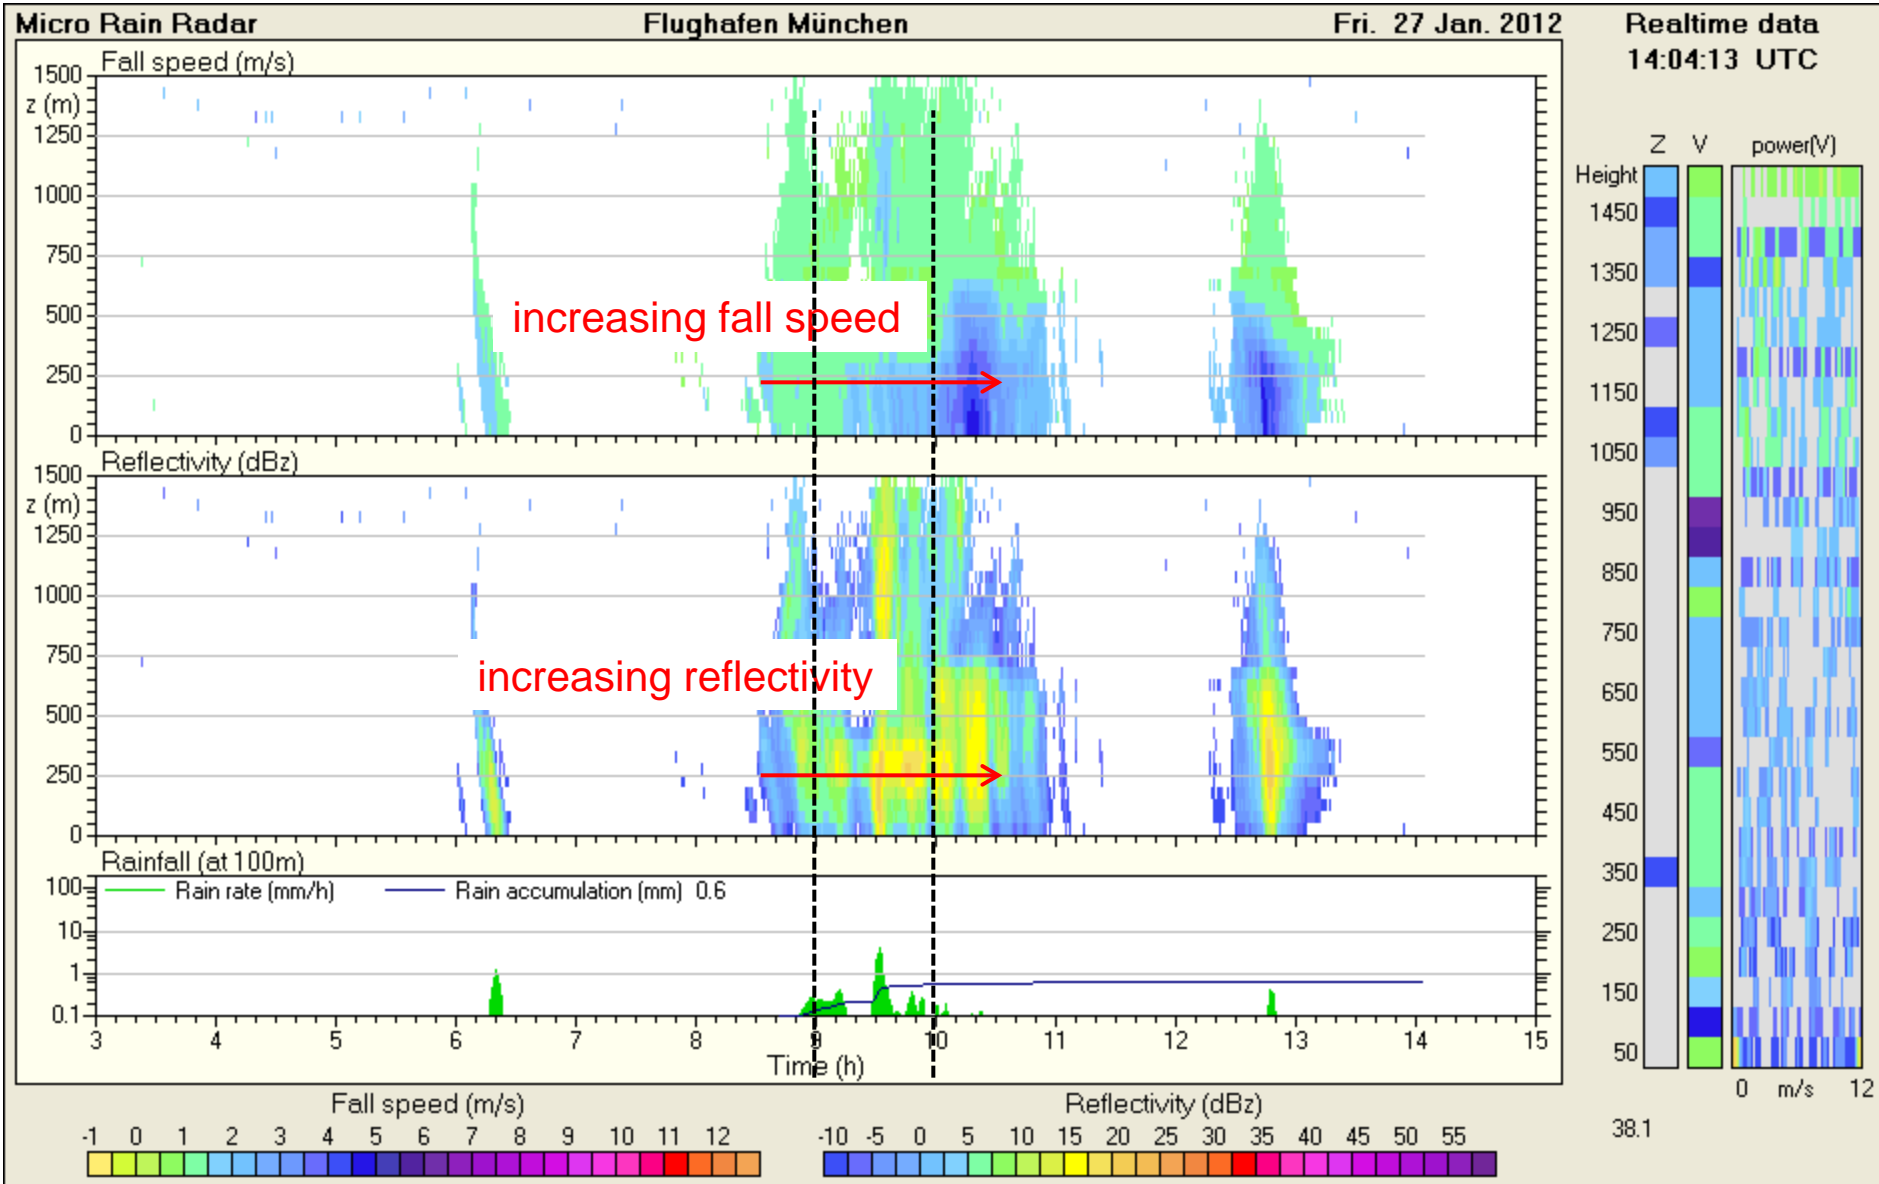

MRR Reflectivity

10:00 UTC

# The fuzzy-logic approach

# Summary

- A nowcasting concept for winter weather conditions has been developed
- The concept is based on winter weather objects
- Analyses and trends of local observations are combined with COSMOMUC forecasts and advection of upstream observations
- A fuzzy-logic approach combines the data with different weights
- To do: translate the winter weather objects into impact for traffic
- Build confidence, create trust, train and educate
