ROZHOVOR

Kybernetický útok se nás pokusil zlikvidovat, škoda může jít do desítek milionů korun, říká šéf Ředitelství silnic

Ondřej Charvát redaktor

2. 6. 2022 00:00 • 7 min čtení

Vnitřní systémy Ředitelství silnic a dálnic jsou již dva týdny zablokované. Generální ředitel ŘSD Radek Mátl odhaduje, že jeho organizace bude fungovat jako před kyberútokem za čtyři až pět měsíců. Autor • ČTK

Kybernetický útok, kterému Ředitelství silnic a dálnic (ŘSD) čelilo v [polovině května](#), bude mít pro státní organizaci tvrdý dopad a dlouho se z něj bude sbírat. Ve firmě nefungují interní systémy

Mělo by ŘSD zaplatit výkupné, které po něm vyžadují hackeři? Experti si myslí, že ne

Ředitelství silnic a dálnic (ŘSD) zvažuje zaplacení výkupného hackerům, kteří jim zablokovali servery a zaměstnancům znemožnili jakýkoliv přístup do systému. Je to ale rozumné? Experti přes IT pro server iROZHLAS.cz odpovídali v anketě na otázku spojené s útokem, se kterým se státní instituce potýká.

Praha 5:00 11. června 2022

Pokud k zaplacení výkupného dojde, nemají ale společnosti záruku, že svá data od hackerů dostanou zpět (ilustrační foto) | Foto: René Volfík | Zdroj: iROZHLAS.cz

2DRoad

- Flagship MetSense product
- 5-in-1 device that delivers:
 - 2D Surface Status (NIR chip with 64 x 64 pixel resolution)
 - 2D Friction (Row based, i.e. 64 data points)
 - Overview Background Image
 - Single Point Surface Temperature (pyrometer)
 - Data Logging (integrated logger with ETH / LTE connectivity)
 - Can collect data from other sensors, e.g. the MetSalt or other 3rd party sensors, if needed. RS485 RTU Modbus readily supported
- **More of a weather station than a sensor!**

MetSense

A new road-weather station paradigm

A new non-intrusive weather camera is helping to provide more accurate and detailed road condition forecasts

4,000

Pixels captured by MetSense 2DRoad camera over a 6x6m area

Road weather forecasts are highly dependent on input data. This data comes from road weather stations (RWS) which measure the ground truth or baseline weather conditions on roads. This truth or baseline then serves as a starting point for a road weather forecast.

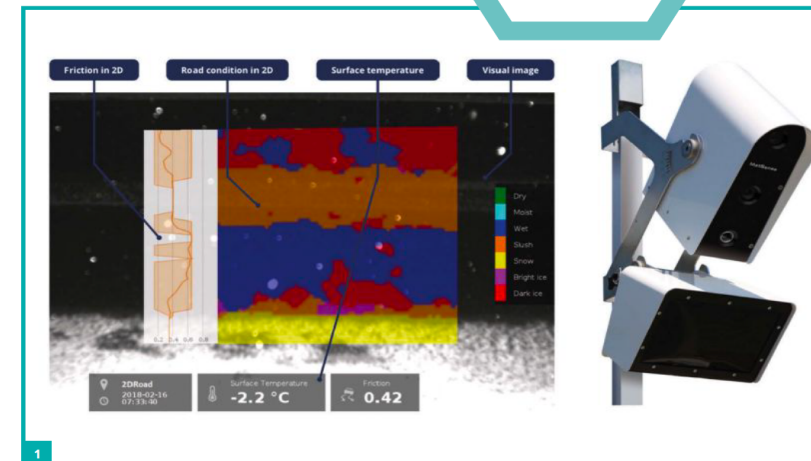

Road and air temperature are measured by almost all RWS. As the air temperature measurement method is standardized, this parameter is highly reliable. Road temperature measurement is, to a large degree, also standardized (PT sensor placed at a set depth). Therefore dense, high quality, and standardized data sets of road and air temperatures are readily available.

When the aforementioned inputs are fed into an advanced road weather forecasting system such as RSI from MetSense's sister company Klimator, road and air temperature can be forecast extremely accurately far into the future.

Measurement challenges

The situation is different for road condition or road status measurements. Traditional RWS only attempt to infer road conditions from the other measured parameters, and rarely measure road conditions directly. If they do measure, they measure only a representative spot either in or in between the wheel tracks.

However, unlike air temperature or road temperature, road condition is not constant for a measurement site – it varies greatly across the road slice, often with three different road conditions at once for a standard winter scenario. Furthermore, different sensors measure and report the road condition differently. As a result, the available data

sets for road condition can be sparse, low quality, and unstandardized.

To make things worse, road condition and road slipperiness forecasts are very sensitive to input data. This means that if the ground truth or baseline measurement is off, wildly inaccurate road condition and road slipperiness may be forecast even a couple of hours into the future.

A high-tech solution

MetSense took on the challenge of lacking road condition data by developing a non-intrusive weather camera, called 2DRoad. 2DRoad

measures road condition with a resolution of over 4,000 pixels captured across an area of up to 6x6m. This means that standard winter scenarios are reported in full context, such as "ice with wet in the wheel tracks", where before only "ice" or "wet" would be reported.

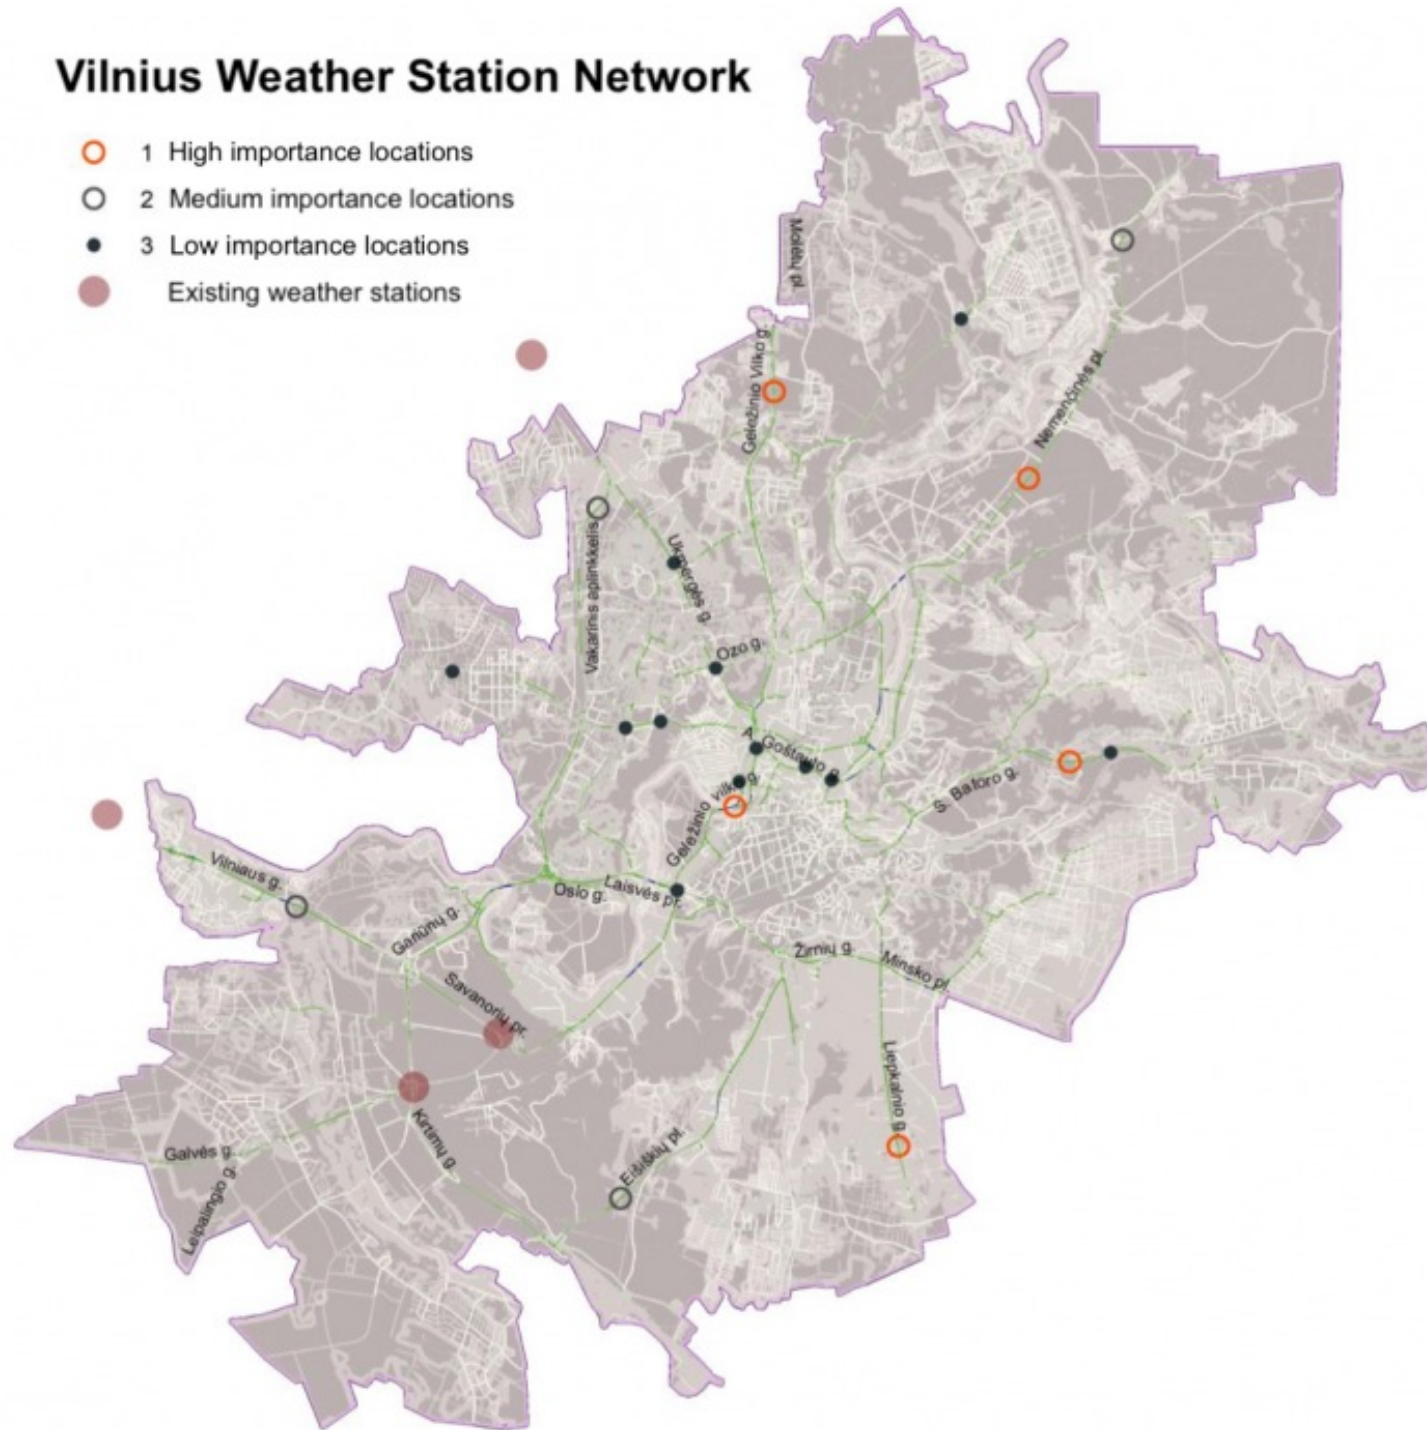

The availability of such high-quality measured road condition data greatly improves the accuracy of road weather forecasts. Furthermore, as the road condition data is presented overlaid on a high-resolution camera image, winter maintenance personnel get insights into the present status of roads that was

APART FROM THE 2DROAD, METSENSE MAKES A LOW-COST MOBILE SENSOR, CALLED METROAD MOBILE, WHICH CAN BE MOUNTED ON A MAINTENANCE VEHICLE, INSPECTION VEHICLE, OR A CITY FLEET VEHICLE

A New Road Weather System Paradigm

- System which uses legacy RWSs
 - Use of historical investments
- System which is built on the world-unique 2DRoad
 - The highest possible quality of road condition detection
- System which uses mobile sensors and IoT stations
 - Cheap densening of the RWS network with mobile sensors and IoT stations
- System which uses the world leading road weather forecasting platform
 - The highest possible forecast quality
- System which is presented in the world leading Smart City Platform
 - Invipo is the recipient of Intertraffic Innovation Award from 2016

Why this way?

- Why not just use MetRoad Mobile for road condition?
 - Data density in the middle of the night?
- Why 2DRoad?
 - Full description of the road
 - User-selectable areas to feed into forecast(s), forecasts extremely sensitive to RC data

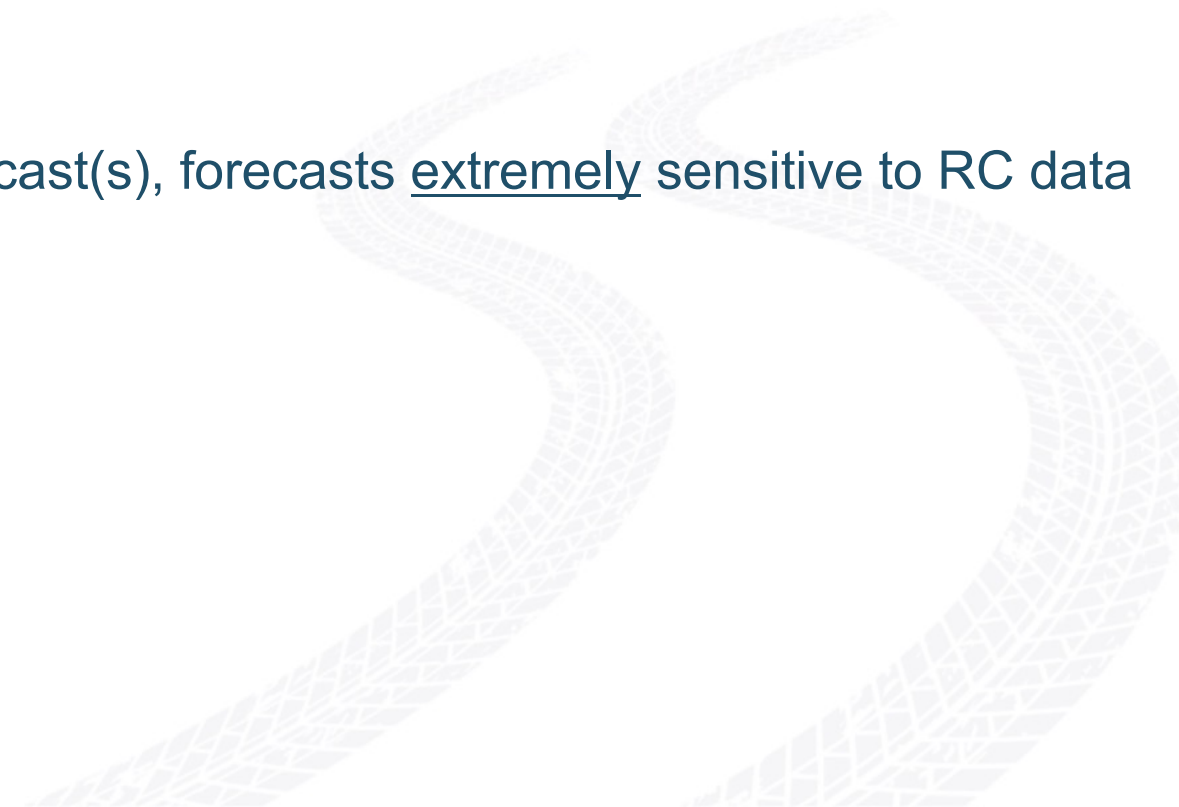

M8 Test Site Duntilland ⓘ

Why this way?

- Why not just use MetRoad Mobile for road condition?
 - Data density in the middle of the night?
 - Why 2DRoad?
 - Full description of the road
 - User-selectable areas to feed into forecast(s), forecasts extremely sensitive to RC data
 - Why IoT?
 - Cheap!!! ~EUR 1k / station
 - Why RSI?
 - The highest possible forecast quality
 - Output into any system
